### 2.7 Problem Solving

ex. Calculate $\overline{\mathrm{CD}}$ to the nearest tenth.

ex. The angle of elevation from the top of one building to the top of an adjacent building is $20^{\circ}$. The angle of depression from the top of that same building to the base of that same adjacent building is $40^{\circ}$. If the measurements are taken from a height of 20 m above the ground, how high is the adjacent building?

ex. The Eiffel tower measures 324 m tall. From a point to the south of the tower, Kolya measures the angle of elevation to the top to be $70^{\circ}$. From a point to the west of the tower, his brother Macéo measures the angle of elevation to the top to be $60^{\circ}$. How far apart are the brothers?
