

3.1 Factors and Multiples of Whole Numbers

Prime numbers: are numbers that have exactly **two** factors; one and itself

ex. 2, 3, 5, 7, 11, 13, 17, 19, 23, 29, 31, 37, 41, 43, ...

Factor: a factor is a number that divides a natural number **exactly**

ex. factors of 12: 1, 2, 3, 4, 6, 12

Multiple: a multiple of a natural number is the **product** of the number and another **natural number**

ex. of 8: 8, 16, 24, 32, 40, 48, ...

ex. Decompose 324 into prime factors ...

ex. Determine the Greatest Common Factor (GCF) between 24 and 60

ex. Determine the Least Common Multiple (LCM) between 15 and 12

① list: 12, 24, 36, 48, 60
15, 30, 45, 60

② 12: 2 · 2 · 3 = 2² · 3
15: 3 · 5

LCM = 60

ex. Simplify $\frac{185 \div 5}{325 \div 5} = \frac{37}{65}$

Ex. $\frac{5}{24} - \frac{1}{22}$

common denominator = LCM

22: 2 · 11
24: 2³ · 3 } LCM = 2³ · 3 · 11 = 264

$\frac{5 \times 11}{24 \times 11} - \frac{1 \times 12}{22 \times 12}$

$\frac{55}{264} - \frac{12}{264} = \frac{43}{264}$

Homefun: Pg. 140 #3ad, (5, 6, 8, 9, 10, 11, 13, 14, 15)ace, 16acde, 17, 19, 20, 22

LCM for 42 and 50

42: 2 · 3 · 7
50: 2 · 5² } LCM = 2 · 3 · 5² · 7 = 1050

See ex. 4 on pg. 138

a) LCM: $16 : 2^4$
 $40 : 2^3 \cdot 5$
LCM = $2^4 \cdot 5$
= 80

GCF: $16 = 2^4$
 $40 = 2^3 \cdot 5$
GCF = $2^3 = 8$
